Procell Therapies Hair Treatment: What to Expect

This handout explains how your hair treatment works and why proper aftercare is essential for optimal results. Our approach combines advanced microchanneling with specialized serums designed to support your hair follicles' natural growth process.

How Procell Microchanneling Activates the Hair Growth Cycle

Microchanneling is a controlled, minimally invasive treatment that creates thousands of precise micro-channels in the scalp. These micro-channels signal to the skin and hair follicles that repair is needed, activating your body's natural healing response.

While this healing response is important, healing alone does not automatically trigger hair growth. For hair follicles to shift back into an active growth phase, the correct biological signals must also be present.

Why Our Serums Matter

Our treatment is paired with professional-grade serums and aftercare that contain **WNT-1 Growth Factor** — a key signaling molecule involved in hair follicle activation.

WNT-1 helps communicate with hair follicle stem cells, supporting the transition from the resting phase back into the active growth phase.

Think of microchanneling as opening the door… and WNT-1 as the message that walks through it, telling the follicle it is safe and supported to begin regenerating.

Why Aftercare Is Essential

After your treatment, your scalp continues to heal and respond to signals for days and weeks. Using the recommended aftercare serums helps reinforce this communication beyond the treatment room.

Consistent aftercare supports stronger, healthier hair growth over time by encouraging follicles to do what they were designed to do naturally.

What This Means for You

We are not forcing hair to grow. Instead, this treatment works with your biology — reminding dormant follicles how to re-enter the growth phase and supporting long-term hair health.
